

Git and Github Page 1 of 50

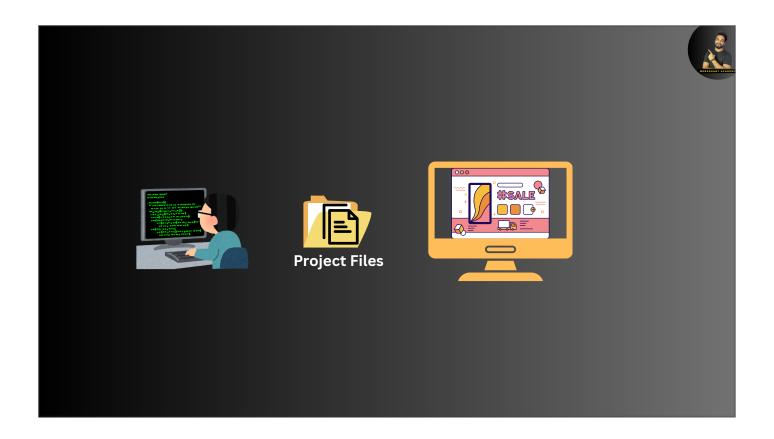

What is Git?

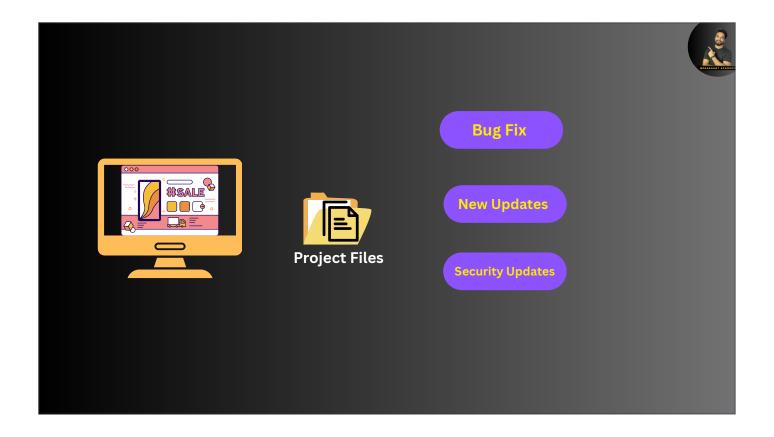

Git is a distributed version control system (VCS).

Git is a tool that helps multiple people work on the same code project or documents by tracking and managing changes to the files.

Git and Github Page 5 of 50

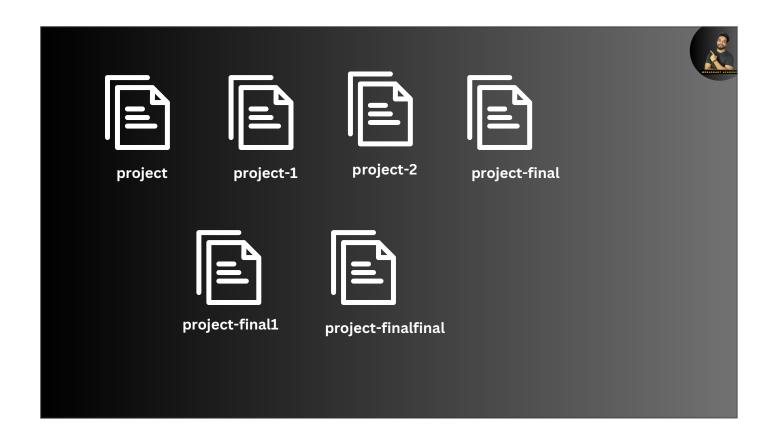

What is VCS?

Every time you make a change, whether it's adding a sentence to a document or altering a line of code, the VCS records and saves the outcome.

Why VCS?

- Backup and Restore: Files are safe against accidental losses or mistakes.
- Collaboration: Multiple people can work on the same project simultaneously.
- Branching and Merging: Users can diverge from the main base of code, experiment, and then bring changes back in line without losing work.
- Tracking Changes: You can see specific changes made and by whom.

Git and Github Page 13 of 50

- Step-by-step installation of Git.
- Configuring Git with your username and email.

Git and Github Page 14 of 50

Configure Git with Username and Email

- \$ git config --global user.name "Paul Philips"
- \$ git config --global user.email paulphilips@email.com
- \$ git config --list

Git and Github Page 15 of 50

Creating Local Git Repo

\$ git init

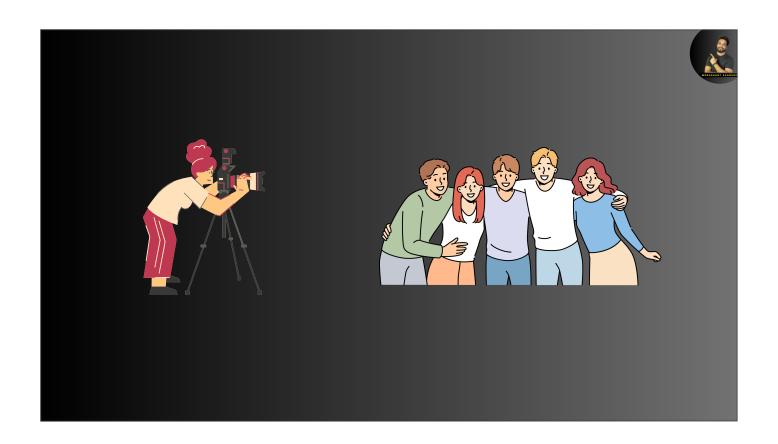

Git and Github Page 16 of 50

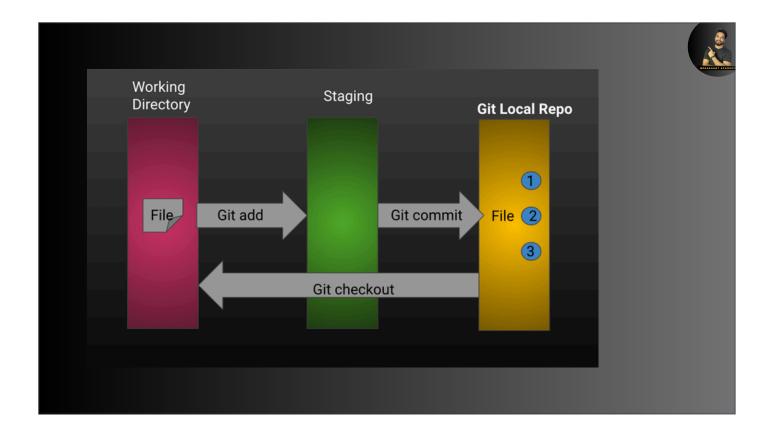

What is Git Commit?

A git commit is a command in Git that captures a snapshot of the project's currently staged changes, creating a permanent record in the repository's history.

Git and Github Page 19 of 50

Negative Cases

If we made any change by mistake and save it

Case1: To undo changes, get the last successful change git restore . or filename (. mean all files)

Case2: If we added the changes using git add then..
git restore --staged <file_path> # To unstage
git restore <file_path> # To discard changes in the working
directory

Git and Github Page 20 of 50

Negative Cases

Case3: Added changes to staging area (didn't commit) after this added more changes to file

//To get the staged changes git restore --worktree index.html

Case4: How about if we did commit also wrong files git reset --soft HEAD^ (uncommit and keep the changes) git reset --hard HEAD^ (uncommit and discard the changes)

Git and Github Page 22 of 50

Useful Log Options

- git log -p -2 (last two commit with diff)
- git log --stat (summary of changes)
- git log --pretty=oneline
- git log --pretty=format:"%h %an, %ar : %s"
- git log -S function_name

Git and Github Page 23 of 50

Useful Log Options

- git log --grep="fix bug" (search commit msg)
- git log --since="2024-01-01"
- git log --until="2024-01-01"
- git log --author="Paul"
- git log --no-merges

A remote repository refers to a version of your project that resides on a network server or a hosted repository on the internet.

Git and Github Page 26 of 50

Git and Github Page 27 of 50

Git and Github Page 28 of 50

Adding Remote Repo

git remote add origin <remote URL> git push -u origin master

Git and Github Page 29 of 50

Working with Remote

To see the remote git link

```
git remote
git remote -v
git remote show origin (to get more info about remote)
git clone
git pull
```

Git and Github Page 30 of 50

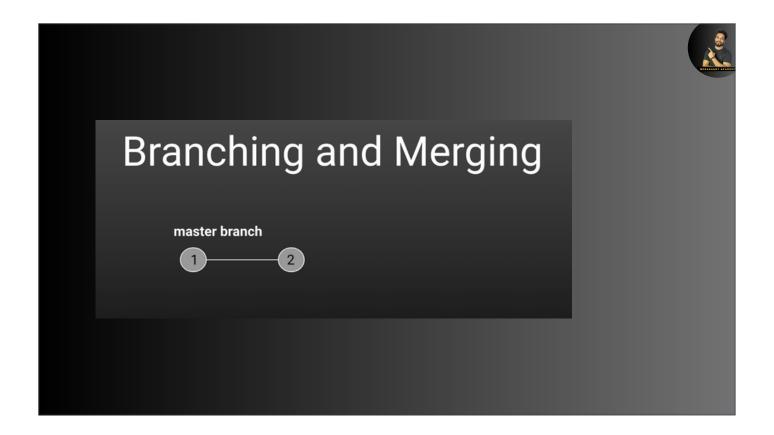

Git and Github Page 31 of 50

Git status	To check for any change in the repo
Git diff	To see the difference of current version with last committed version
Git pull	To fetch the latest files from remote repo
Git add	To add the modified files in staging area
Git commit	To add the changes in git repo
Git push	To push the committed changes in Remote repo
Git log	To see the old commits history

Git Ignore

In case you don't want to commit some files from your working directories then add those files name in .gitignore file.

Will be useful when your file contain confidential info.

Git and Github Page 41 of 50

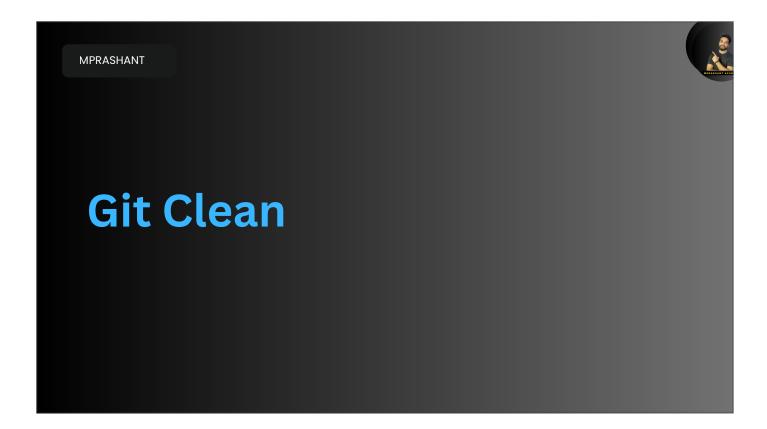

Cloning

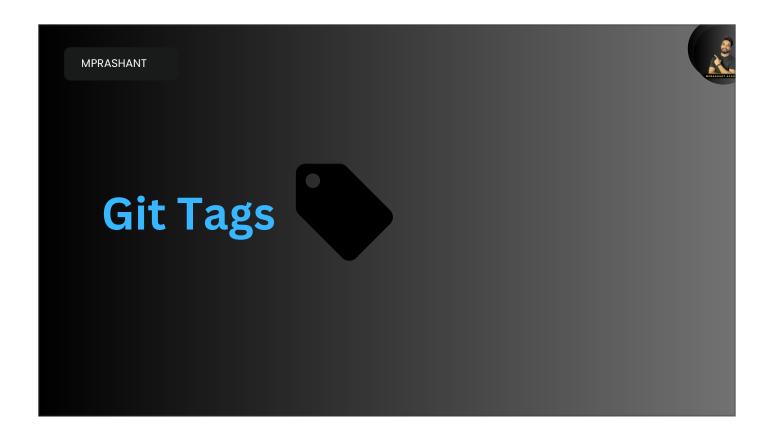

To get the remote repo into your local system.

git clone <remote_repo_link>

Git and Github Page 42 of 50

Git and Github Page 43 of 50

Git and Github Page 44 of 50

Git Tagging

To create annotated tags

git tag -a v1.0 -m "My version 1.0"

To show tags data git show v1.0

To tag old commit in case you forgot

git tag -a v1.2 <commit_no>

Git and Github Page 45 of 50

Git Tagging

To delete a tag git tag -d <tag_no>

Tags created remain local, to move it to remote:

git push origin v1.5 git push origin --tags (For all tags together)

In case in future, if you wanna give patch for v1.2 release let's say git checkout -b version2 v2.0.0 (it will create new branch also)
